A differential equation (de) is an equation involving a function and its deriva-tives. Differential equations are called partial differential equations (pde) or or-dinary differential equations (ode) according to whether or not they contain partial derivatives. The order of a differential equation is the highest order derivative occurring.

The Mellin transform is essential for this book, especially coupled with Slater's theorem. Some multi-dimensional transforms are listed. At the end basic facts on singular differential equations are mentioned, including those with Bessel operators, and for them an important classification of I. A. Kipriyanov is formulated.

History. Differential equations first came into existence with the invention of calculus by Newton and Leibniz.In Chapter 2 of his 1671 work Methodus fluxionum et Serierum Infinitarum, Isaac Newton listed three kinds of differential equations: $y' = f(x)$, $y' + p(x)y = q(x)$, and $y' + p(x)y = q(x)$. In all these cases, y is an unknown function of x (or of t), and f is a given function. He solves these examples and ...
