Blackwater fever is a complication of malaria infection in which red blood cells burst in the bloodstream ( ), releasing hemoglobin directly into the blood vessels and into the urine, frequently leading to kidney failure. The disease was first linked to malaria by the Sierra Leonean physician Dr John Farrell Easmon in his 1884 pamphlet entitled *The Nature and Treatment of Blackwater Fever*.

Abstract. Blackwater fever (BWF) is a severe clinical syndrome, characterized by intravascular hemolysis, hemoglobinuria, and acute renal failure that is classically seen in European expatriates chronically exposed to *Plasmodium falciparum* and irregularly taking quinine. BWF virtually disappeared after 1950, when chloroquine superseded quinine.

hemoglobinuria, one of the less common yet most dangerous complications of malaria. It occurs almost exclusively with infection from the parasite *Plasmodium falciparum*. Blackwater fever has a high mortality. Its symptoms include a rapid pulse, high fever and chills, extreme prostration, a rapidly developing anemia, and the passage of urine that is black or ...
