Since a heat pump is more efficient than a gas furnace at higher temperatures, the dual fuel system defaults to a heat pump on milder days. Natural gas is more efficient for bigger heating loads, so the dual fuel system uses gas when temperatures get really low. If it were always that simple, you'd be all-in for dual fuel no matter what. So ...

Many new gas furnaces come equipped with a natural gas valve but have a propane conversion kit with the new natural gas valve so it can be quickly converted in the field depending on the type of fuel delivered to the gas furnace. After a new installation of a gas furnace, the furnace should be inspected by the local inspections department.

Refinery furnaces are mostly Balanced draft (i.e. with FD and ID fan). Attached diagram will help engineers to understand typical signature of furnace draft. 1. Radiant arch pressure is the maximum pressure point in furnace. 2. Maintaining it negative will ensure smooth operation. 3. Furnace efficiency can be improved in following areas:

The combustion of a stoichiometric mixture of fuel and oxidizer (e.g. two moles of hydrogen and one mole of oxygen) in a steel container at 25 °C (77 °F) is initiated by an ignition device and the reactions allowed to complete. When hydrogen and oxygen react during combustion, water vapor is produced.
