The Functional Independence Measure (FIM) is an 18-item measurement tool that explores an individual's physical, psychological and social function.[1] The tool is used to assess a patient's level of disability as well as change in patient status in response to rehabilitation or medical intervention.[1] [2]

Functional Independence Measure (FIM) - Physiopedia

Functional Independence Measure (FIM): The FIM is an 18-item, clinician-reported scale that assesses function in six areas including self-care, continence, mobility, transfers, communication, and cognition. Each of the 18 items is graded on a scale of 1–7 based on level of independence in that item (1 = total assistance required, 7 = complete independence). 7,8 FIM scores can be measured at admission to and discharge from inpatient rehabilitation.
