This guide presents a unified approach to the design of structural steel members with web openings. The approach is based on strength criteria rather than allowable stresses, because at working loads, locally high stresses around web openings have little connection with a member's deflection or strength.

Structural Shapes - standard steel configurations produced by steel mills such as wide flanges, channels, angles, pipe, tubes, etc. Structural Steel - the structural elements that make up the frame that are essential to supporting the design loads, e.g. beams, columns, braces, plate, trusses, and fasteners. It does not include for example cables,
