In mathematics, a Markov decision process is a discrete-time stochastic control process. It provides a mathematical framework for modeling decision making in situations where outcomes are partly random and partly under the control of a decision maker. MDPs are useful for studying optimization problems solved via dynamic programming and reinforcement learning. MDPs were known at least as early as the 1950s; a core body of research on Markov decision processes resulted from Ronald Howard's 1960 bo

### HHDS.17 - Markov Decision Processes and Its Applications ...

Markov decision processes are essentially Markov chains with an immediate-cost function, and can be used to model a variety of situations where a decision maker has partial control over the system. They have a large number applications, both practical and theoretical, and various algorithms have been developed to solve them.

A Markov Decision Process is an extension to a Markov Reward Process as it contains decisions that an agent must make. All states in the environment are Markov. In a Markov Decision Process we now have more control over which states we go to.

Stochastic games generalize both Markov decision processes and repeated games. Two-player games. Stochastic two-player games on directed graphs are widely used for modeling and analysis of discrete systems operating in an unknown (adversarial) environment. Possible configurations of a system and its environment are represented as vertices, and ...
