The Triune Brain In

The triune brain is a model of the evolution of the vertebrate forebrain and behavior, proposed by the American physician and neuroscientist Paul D. MacLean. MacLean originally formulated his model in the 1960s and propounded it at length in his 1990 book *The Triune Brain in Evolution*. The triune brain consists of the reptilian complex, the paleomammalian complex (limbic system), and the neomammalian complex (neocortex), viewed each as independently conscious, and as structures ...

Triune brain - Wikipedia

The triune brain is a concept that neuroscientist Paul MacLean developed to refer to the three parts of the brain in human beings. These parts develop in different stages of the evolutionary cycle, which is why people say they're created from the bottom up. This means that the oldest, most primitive part of the brain develops in the uterus.

MacLean's notion of a hierarchical structure represented by the triune brain had popular appeal, and it reached beyond the research community as reflected by the books *The Ghost in the Machine* (Koestler, 1967) and *The Dragons of Eden* (Sagan, 1978), in which MacLean's notion of the triune

In the 1960s, American neuroscientist Paul MacLean formulated the 'Triune Brain' model, which is based on the division of the human brain into three distinct regions. MacLean's model suggests the human brain is organized into a hierarchy, which itself is based on an evolutionary view of brain development. The three regions are as follows:

In striving to understand the impact of unhealed trauma on the human brain, it's helpful to have a basic understanding of the brain. A simple model of the human brain is to envision it as three separate brains (the triune brain); each with its own separate functions and sense of time. The triune brain (MacLean, 1990): 1.
