Time Series Analysis comprised methods for analyzing time series data in order to extract meaningful statistics and other characteristics of the data. It is different from Time Series forecasting which is the use of a model to predict future values based on previously observed values.

questions posed by these time correlations is commonly referred to as time series analysis. The impact of time series analysis on scientific applications can be partially documented by producing an abbreviated listing of the diverse fields in which important time series problems may arise. For example, many fa-

Additive Model for Time Series Analysis. If  $y_t$  is the time series value at time  $t$ .  $T_t$ ,  $S_t$ ,  $C_t$ , and  $R_t$  are the trend value, seasonal, cyclic and random fluctuations at time  $t$  respectively. According to the Additive Model, a time series can be expressed as.  $y_t = T_t + S_t + C_t + R_t$ .

In the context of statistics, econometrics, quantitative finance, seismology, meteorology, and geophysics the primary goal of time series analysis is forecasting. In the context of signal processing, control engineering and communication engineering it is used for signal detection and estimation.

Many applications of regression analysis involve both independent/predictor and dependent/response variables that are time series, that mean, the variables are recorded at time sequence. The assumption of uncorrelated or independent errors that is typically made for regression data that is not time-dependent is usually not appropriate for time ...
